

Appln. No. 10/645,678
Amendment dated May 11, 2007
Reply to Office Action mailed March 12, 2007

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims (deleted text being struck through and added text being underlined):

1. (Previously Presented) A method for controlling utilization of an external power switch of an information handling system, comprising:

providing an information handling system with a housing having at least a closed orientation and an open orientation, the information handling system including a power switch located on an external surface of the housing of the information handling system when the housing is in the closed orientation such that the external power switch may be actuated by contact when the information handling system is in the closed orientation;

detecting an indication from a display closed switch of the information handling system; and

disabling a transition from a power-off state to a power-on state from initiation by the external power switch of the information handling system when the detected indication of the display closed switch indicates that the housing of the information handling system is in the closed orientation.

2. (Cancelled)

3. (Original) The method as described in claim 1, wherein the display closed switch includes a locking member disposed on at least one of a display portion of the information handling system and an input portion of the information handling system; and

a receptacle disposed on at least one of a display portion of the information handling system and an input portion of the information handling system;

wherein positioning of the locking member within the receptacle provides in the indication that the display of the information handling system is closed.

Appln. No. 10/645,678
Amendment dated May 11, 2007
Reply to Office Action mailed March 12, 2007

4. (Previously Presented) The method as described in claim 1, wherein the information handling system may obtain at least three orientations, the at least three orientations including the closed orientation, the open orientation, and a tablet orientation;

wherein the external power switch is located on the external surface of the housing of the information handling system when the housing is in the tablet orientation such that the external power switch may be actuated by contact when the housing of the information handling system is in the tablet orientation.

5. (Original) The method as described in claim 4, wherein each of the at least three orientations includes a criterion for operation of the external power switch which is different from at least one other criterion of the other two orientations.

6. (Original) The method as described in claim 4, wherein the open orientation includes a display disposed on a display portion of the information handling system and an input device disposed on an input portion of the information handling system, the display and input device both orientated toward a user of the information handling system, and wherein the tablet orientation includes the display disposed on a display portion of the information handling system oriented toward the user, the display positioned over the input device of the input portion of the information handling system so that the input device disposed on the input portion for utilization in the open orientation is not operable by a user when in the tablet orientation.

7. (Original) The method as described in claim 1, wherein disabling includes disabling an initial criterion of the external power switch and initiating a second criterion for utilization of the external power switch.

Amendment dated May 11, 2007
Reply to Office Action mailed March 12, 2007

8. (Previously Presented) The method as described in claim 7, wherein the second criterion includes initiating a period of time for interaction with the external power switch before implementation of function from the external power switch.

9. (Previously Presented) An information handling system, comprising:

a display portion including a display device;

an input portion including an input device for input of data by a user of the information handling system, the input portion rotatably connected to the display portion so that the information handling system is positionable in at least two orientations, the at least two orientations including a closed orientation and an open orientation, the open orientation enabling a user to interact with the input device on the input portion;

a locking member disposed on at least one of a display portion of the information handling system and an input portion of the information handling system; and

a receptacle disposed on at least one of a display portion of the information handling system and an input portion of the information handling system; and

an external power switch located on an external surface of one of the display portion and the input portion such that the external power switch is manipulable by a user in both the open orientation of the information handling system and the closed orientation of the information handling system;

wherein positioning of the locking member within the receptacle disables at least one criterion for transition from a power-off state to a power-on state of the information handling system as initiated by the external power switch of the information handling system.

10. (Cancelled)

11. (Previously Presented) The information handling system as described in claim 9, wherein the information handling system may obtain at least three orientations, the at least three orientations including the closed orientation, the open orientation and a tablet orientation;

wherein the external power switch is located on the external surface of one of the display portion and the imputer portion of the information handling system when the information handling system is in the tablet orientation such that the external power switch may be actuated by contact when the information handling system is in the tablet orientation.

12. (Original) The information handling system as described in claim 11, wherein each of the at least three orientations includes a criterion for operation of the external power switch which is different from at least one other criterion of the other two orientations.

13. (Previously Presented) The information handling system as described in claim 11, wherein the open orientation is characterized by the display and the input device both being orientated toward a user of the information handling system, and wherein the tablet orientation is characterized by the display being oriented toward the user and the display being positioned over the input device of the input portion of the information handling system so that the input device disposed on the input portion for utilization in the open orientation is not operable by a user when in the tablet orientation.

14. (Original) The information handling system as described in claim 9, wherein disabling includes disabling an initial criterion of the external power switch and initiating a second criterion for utilization of the external power switch.

15. (Previously Presented) The information handling system as described in claim 14, wherein the second criterion includes initiating a period of time for interaction with the external power switch before implementation of function from the external power switch.

16. (Previously Presented) A method for controlling utilization of an external power switch of an information handling system, the information handling system capable of attaining at least three different orientations for utilization by a user, comprising:

detecting an indication from an information handling system of the orientation of the information handling system into one of the at least three orientations, the at least three orientations including an open orientation, a closed orientation and a tablet orientation, each of the orientations being characterized by the external power switch being externally accessible and being actuatable by contact with the external power switch; and

instigating a criterion for transition from a first power state to a second power state of the information handling system as initiated by the external power switch of the information handling system, wherein the criterion is dependent on which of the at least three orientations the information handling system is positioned at a time of actuation of the external power switch.

17. (Original) The method as described in claim 16, wherein the first power state is a power-off state and the second power state is a power-on state.

18. (Original) The method as described in claim 16, wherein the orientation of the information handling system is detected through use of a display closed switch, the display closed switch including

a locking member disposed on at least one of a display portion of the information handling system and an input portion of the information handling system; and

a receptacle disposed on at least one of a display portion of the information handling system and an input portion of the information handling system;

wherein positioning of the locking member within the receptacle provides in the indication that the display of the information handling system is closed.

19. (Original) The method as described in claim 16, wherein each of the at least three orientations includes a criterion for operation of the external power switch which is different from at least one other criterion of the other two orientations.

20. (Original) The method as described in claim 16, wherein the open orientation includes a display disposed on a display portion of the information handling system and an input device disposed on an input portion of the information handling system, the display and input device both orientated toward a user of the information handling system, and wherein the tablet orientation includes the display disposed on a display portion of the information handling system oriented toward the user, the display positioned over the input device of the input portion of the information handling system so that the input device disposed on the input portion for utilization in the open orientation is not operable by a user when in the tablet orientation.

21. (Original) The method as described in claim 16, wherein the instigated criterion includes at least one of initiating a period of time for interaction with the external power switch before implementation of function from the external power switch and requiring at least two manipulations of the external power switch for operation of the external power switch.

22. (Original) The method as described in claim 7, wherein the second criterion includes requiring at least two manipulations of the external power switch for operation of the external power switch.

23. (Original) The information handling system as described in claim 14, wherein the second criterion includes requiring at least two manipulations of the external power switch for operation of the external power switch.

24. (Original) The information handling system as described in claim 9, wherein the information handling system may obtain at least three orientations, the at least three orientations including the closed orientation, the open orientation and a tablet orientation;

wherein the external power switch is located on the external surface of one of the display portion and the imputer portion of the information handling system when the information handling system is in the tablet orientation such that the external power switch may be actuated by contact when the information handling system is in the tablet orientation;

wherein each of the at least three orientations includes a criterion for operation of the external power switch which is different from at least one other criterion of the other two orientations;

wherein the open orientation is characterized by the display and the input device both being orientated toward a user of the information handling system, and wherein the tablet orientation is characterized by the display being oriented toward the user and the display being positioned over the

input device of the input portion of the information handling system so that the input device disposed on the input portion for utilization in the open orientation is not operable by a user when in the tablet orientation;

wherein disabling includes disabling an initial criterion of the external power switch and initiating a second criterion for utilization of the external power switch; and

wherein the second criterion includes initiating a period of time for interaction with the external power switch before implementation of function from the external power switch.
